Attachment A – Stormwater Management Drawings

Attachment B – Crossing 01 – Gampe Drive – 450 Dia

Attachment C – Crossing 02 – Gampe Drive – 1800 Dia

Attachment D - Hydraulic Analysis - Diversion Drainage - Lots 1 to 3 Access

1. Introduction

This Stormwater Management Plan has been prepared in response to specific conditions specified in Development Approval for the subdivision of 1843 Mulligan Highway Cooktown (Lot 216 SP137304) referenced DA 4608 dated 29/10/24, issued by Cook Shire Council.

2. Site Information

Figure 1
Site Topography

Stage 1 of the development (the stage to which the above referenced DA refers) is located generally along the line of a low spur roughly defined by the alignment of Gampe Drive. Flow from Gampe Drive is generally North and South from Gampe Drive.

General topography in the environs is shown in Fig 1 (Extract from Qld globe)

3. Development Approval Conditions

Development approval conditions are discussed as follows:

3.1 Condition 15

DRAINAGE

15. Undertake a local drainage study / plan of the site to determine the measures required to ensure immunity for the building envelopes. The drainage study / plan must demonstrate the drainage within each allotment and identify the existing creeks and drainage lines. In particular, the study must address the following:

a. The contributing catchment boundaries;

Boundaries of external catchments contributing to the site flow regime are mapped as follows:

Figure 2
External Catchments

b. The extent of the 100-year ARI flood event in relation to the building envelopes;

i) Caroline Creek

Caroline Creek Invert level immediately upstream of Mulligan Highway is approximately RL30 compared with the existing surface level at Lot 1 (the lowest of the proposed new lots) is of the order of RL42.

It is considered extremely unlikely that flooding of Caroline Creek would affect proposed building envelopes.

ii) Watercourse crossing Gampe Drive (Crossing 02)

Review of the flood hydraulics associated with the existing 1800dia culvert, compared with general levels of the nominated building pad areas are summarised as follows:

Location	Description	RL
Crossing 02 (Gampe Drive)	Q100 Water Surface Level	40.0
Lot 3	General Building Pad Surface	44.0
Lot 4	General Building Pad Surface	43.5
Lot 12	General Building Pad Surface	44.0

The lots are not affected by Q100 ARI flooding.

c. Primary and secondary flow paths through the site, and through each lot relative to the identified building envelopes;

Flow paths affecting the proposed building pads are demonstrated at Attachment A.

Generally, building pad areas are able to be isolated from flow paths by the construction of minor diversion drains constructed upstream of the building pad areas discharging along the contour to regenerate sheet flow.

It is noted however that specific issues relate to Lots 1 and 2.

These lots are affected by significant re-entrants flowing approximately to the North. Refer Fig 3.

Figure 3
Lots 1 to 3
Works in Mitigation of Development

Mitigation treatment is discussed as follows:

The development approval requires the provision of access to Lots 1 to 3 inclusive from a new laneway from Gampe Drive, rather than from direct access from Mulligan Highway.

The development approval conditions require the building pads and the property accesses to be trafficable at the Q10 ARI event. The decision was made to increase the flood immunity level to the Q100 ARI event in order to reduce the risk of overtopping of the low embankment of the new laneway, seen to be a potential maintenance issue without provision of scour protection to the downstream embankment batter, and to provide control of the overland flow that would otherwise impact the utility of the proposed building pad areas.

Accordingly, the key design parameter for the diversion drain was the requirement to convey the Q100 flows without overtopping. Satisfaction of that requirement necessitated the inclusion of a cross road culvert approximately midway along the length of the laneway.

Discharge from the diversion drain is controlled with the inclusion of a level spreader located at the Northern end of the Drain.

Detailed hydraulic analysis of the system shown at Fig 2 are given at Attachment D.

d. Identify the locations of the watercourses through the site as mapped on State mapping including identifying the location of Caroline Creek and the unnamed southern tributary in relation to the lot layout and lot boundaries;

Watercourse alignments are indicated by contour information at Fig 4.

The survey shows that building envelopes are suitable for construction and use of residential structures.

Figure 4
Mapped Creek Alignments

e. Confirm with suitable level data, the location of flow paths that run beside or across Gampe Drive including assessments of existing crossroad drainage infrastructure capacity and any upgrades required to achieve the capacity nominated in the FNQROC Development Manual and the Queensland Urban Drainage manual (minimum 10-year ARI capacity unless otherwise approved by Council);

Time of Concentration

STORMWATER MANAGEMENT PLAN
1843 Mulligan Highway Cooktown
20/08/2025

Catchment Name		EC01	EC02	EC03	EC04
H1	m	120	180.00	60.00	43.1
H2	m	52	40.00	43.10	41.8
H Change	m	68.00	140.00	16.90	1.30
Main Stream Length	m	0.66	2.16	1.80	0.35
Mainstream Slope	%	10.30	6.48	0.94	0.37
Catchment Area	Ha	1.7	117.00	33.00	1.62
Tine Of Concentration	min	22.77	53.55	74.53	23.58

Catchment Details are given at Fig 2.

Crossing 01 – Gampe Drive – 450dia RCP

Analys indicates that Crossing 01 is essentially a relief structure, without the capacity to convey catchment flows under the road. Excess flows have previously been diverted along Gampe Drive to discharge at existing Crossing 02.

The advent of the new allotment crossovers results in the necessity to cater for such flows, either with the installation of crossover culverts, such as in the case of Lot 9, or for the discharge of the flows withing the allotments. In the latter cases, diversion channels are discharged along the line of the existing contours in order to generate sheet flow lateral to the line of the contours.

Detailed hydraulic analysis is given at Attachment C

Figure 6

STORMWATER MANAGEMENT PLAN
1843 Mulligan Highway Cooktown
20/08/2025

Figure 7

Crossing 02 – Gampe Drive – 1800dia CSP

Crossing conveys significant flows from the upstream catchment. Existing culvert does not have capacity to accommodate flows from Q10 ARI under the road.

Figure 8

Figure 9

Detailed analysis of the overtopping characteristics are provided at Attachment C however the results can be summarised as follows:

Overtopping Characteristics

ARI	10	100	Year
Floodway Invert	42.62	42.62	m
Water Surface Level	42.9	43	m
Flow Depth	0.28	0.38	m
Flow Velocity	0.74	0.91	m/s
VxD	0.2072	0.3458	m ² /s

The system provides appropriate depth and VxD products at the Q10 ARI event. Flow depth associated with the Q100 ARI is marginally greater than the normally expected maximum, however the VxD product is well within normally expected bounds for both pedestrian and vehicular stability.

f. Identify any requirement for drainage easements; and

Development on the proposed lots is controlled by surveyed building envelopes. Additional development control with the use of easements is not seen to be warranted, unless the benefit of such easements is to Cook Shire Council for maintenance purposes.

g. Proposed points of discharge for each lots including where such discharge may include maintaining overland flow across inter-allotment boundaries. The study must be endorsed by Council prior to the issue of a Development Permit for Operational Works. The approved works must be completed and accepted by Council prior to Council approval of the Plan of Survey.

Refer Section 3.4 below

3.2 Condition 16

16. Existing watercourse systems and drainage areas within the subject site must be left in their current state, including no channel alterations and no removal of vegetation, unless otherwise approved.

Existing watercourse systems and drainage areas are generally maintained in their pre-development state, the exception being the water courses flowing West from the Mulligan Highway necessarily diverted by the DA requirement to provide a common access to Lots 1 to 3 inclusive.

Such works are described more fully at Section 3.1 (c) above.

3.3 Condition 17

17. Flow paths through the site must be clearly identified in relation to the lot layout and lot boundaries to confirm that no layout changes are required for access or use of the land for accommodating a Dwelling House with appropriate setbacks to drainage lines. If updates are required to the lot layout based on the location of the bed and banks of Caroline Creek or the unnamed southern tributary these must be provided on an updated dimensioned layout plan. The plan must be provided with the Operational Works Application for Roadworks.

Advice Note - There appears to be a slight misalignment between the state mapping of the watercourse and the actual location of the Gampe Drive cross-road culvert and downstream drainage path. The lot layout boundary of the access leg to the northern balance land (between Lots 3 and 4) appears to have a similar alignment to the State Mapping. These conditions require the drainage path alignment to be reconfirmed on site and the lot layout verified following that site verification.

Flow paths, both existing and proposed, are detailed at Attachment A.

3.4 Condition 18

18. All stormwater from each lot must be directed to a lawful point of discharge or maintained as overland flow based on current site conditions such that it does not adversely affect the building envelopes and access of the proposed lots to the requirements and satisfaction of the Director Infrastructure.

Lawful point of discharge for the site is provided by Caroline Creek, which comprises the Northern boundary of the site.

As to the requirement for the specification of lawful points of discharge for the proposed allotments it is noted that in the main interallotment runoff is provided generally by overland flow. Such flow regime is to be maintained.

It is noted that there is no requirements for the nomination of a lawful point of discharge unless there is a material change to the runoff characteristics, including discharge location and flow rate.

In this instance, it is appropriate to address such determinants with reference to State Development Code, in particular the Acceptable Solutions specified by that Code.

NMP 1.8 defines acceptable solutions as follows:

NMP 1.8 – STORMWATER DRAINAGE		
PERFORMANCE CRITERIA		ACCEPTABLE SOLUTIONS
Roof water and surface water		
P1	Roof water and surface water must not cause a health risk to the occupants of a building or damage to adjoining land or buildings.	A1 (a) Roof and surface water is conveyed to the kerb and channel or an inter-allotment drainage system in accordance with AS/NZ3500.3.2. (b) Where an inter-allotment drainage system is not available or it is not possible to convey the roof and surface water to the kerb and channel, absorption trenches complying with AS/NZ 3500.3.2 Parts 6.4 and 6.5 are installed at least 3.0 metres from any downstream boundary.
Natural flow of surface water		
P2	The natural flow of surface water from the property or adjoining properties must not be altered so as to cause a health risk to the occupants of a building or damage to adjoining land or buildings, in the immediate area.	A2 Where retaining walls, fences, buildings or other barriers, which would cause a "damming effect" and produce a concentrated flow at an outfall, are constructed either upstream or downstream, a drainage system is installed to discharge the surface water in accordance with A1.

Figure 10
Extract from NMP 1.8

It is noted that there is no downstream interallotment drainage system and there is no existing (or proposed) kerb and gutter. Consequently alternative A1 (b) is proposed. In this instance absorption trenches are to be located at least 3.0m upstream of the downstream building pad boundary.

Details of proposed works to be provided in associated with building application.

A2

Where retaining walls, fences, buildings or other barriers, which would cause a "damming effect" and produce a concentrated flow at an outfall, are constructed either upstream or downstream, a drainage system is installed to discharge the surface water in accordance with A1.

Condition P2 is not relevant to this discussion.

4. Conclusion

This report addresses the requirements of Council's development approval for the subdivision, demonstrating compliance with the conditions or providing an appropriate rationale approval where compliance is not achievable.

A handwritten signature in black ink, appearing to read 'CL', enclosed within a large, loopy oval shape.

Summary for Subcatchment 1S: Mulligan

Runoff = 6.8231 m³/s @ 1.25 hrs, Volume= 32.751 MI, Depth= 101 mm
 Routed to Pond 3P : CH250 Culvert

Runoff by Rational method, Rise/Fall=1.0/1.0 xTc, Time Span= 0.00-3.00 hrs, dt= 0.01 hrs
 Cooktown 100-Year Duration=80 min, Inten=90.5 mm/hr, Cf=1.20

Area (ha)	C	Adj	Description
32.3000	0.70		
32.3000	0.70	0.84	Weighted Average, Frequency Adjusted
32.3000			100.00% Pervious Area

Tc (min)	Length (meters)	Slope (m/m)	Velocity (m/sec)	Capacity (m ³ /s)	Description
75.0					Direct Entry,

Subcatchment 1S: Mulligan

This report was prepared with the free HydroCAD SAMPLER, which is licensed for evaluation and educational use ONLY. For actual design or modeling applications you MUST use a full version of HydroCAD which may be purchased at www.hydrocad.net. Full programs also include complete technical support, training materials, and additional features which are essential for actual design work.

Summary for Subcatchment 7S: EC04

Runoff = 0.3380 m³/s @ 0.32 hrs, Volume= 1.622 MI, Depth= 101 mm
 Routed to Pond 3P : CH250 Culvert

Runoff by Rational method, Rise/Fall=1.0/1.0 xTc, Time Span= 0.00-3.00 hrs, dt= 0.01 hrs
 Cooktown 100-Year Duration=80 min, Inten=90.5 mm/hr, Cf=1.20
